# Part I: Index theorem

("Number" of eigen-spinors of Dirac operator with zero eigenvalue)

Let's start from the basics of the Dirac operator

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬる

euclidean, compact (without boundary), spin manifold
 can define Dirac fermion on the manifold

even-dimensional, orientable manifold to define chirality

$$\gamma_{2n+1} = \frac{1}{(2n)!} \epsilon_{\mu_1 \cdots \mu_{2n}} \gamma^{\mu_1} \cdots \gamma^{\mu_{2n}}$$
$$(\gamma_{2n+1})^2 = 1$$

So the eigenvalue of  $\gamma_{2n+1}$  is  $\pm 1$ . It is called chirality. On an even-dimensional, orientable manifold one can define chiral fermion on the manifold.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

euclidean, compact (without boundary), *spin* manifold
 can define Dirac fermion on the manifold

even-dimensional, orientable manifold to define chirality

$$\begin{array}{lll} \gamma_{2n+1} & = & \displaystyle \frac{1}{(2n)!} \epsilon_{\mu_1 \cdots \mu_{2n}} \gamma^{\mu_1} \cdots \gamma^{\mu_{2n}} \\ (\gamma_{2n+1})^2 & = & 1 \end{array}$$

So the eigenvalue of  $\gamma_{2n+1}$  is  $\pm 1$ . It is called chirality. On an even-dimensional, orientable manifold one can define chiral fermion on the manifold.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

$$\not\!\!\!D \psi = \lambda \psi$$

 ${\ensuremath{\mathcal{D}}}$  is the Dirac operator in presence of gauge and/or spin connection

Define Chiral spinors

$$\psi_{\pm} = \mathcal{P}_{\pm}\psi$$
 ,  $\mathcal{P}_{\pm} = \left(\frac{1\mp\gamma_{2n+1}}{2}\right)$ 

action of Dirac operator flips chirality

$$\not\!\!\!D \psi = \lambda \psi$$

 ${\ensuremath{\mathcal{D}}}$  is the Dirac operator in presence of gauge and/or spin connection

Define Chiral spinors

$$\psi_{\pm} = \mathcal{P}_{\pm}\psi$$
 ,  $\mathcal{P}_{\pm} = \left(\frac{1 \mp \gamma_{2n+1}}{2}\right)$ 

action of Dirac operator flips chirality

$$\not\!\!\!D\,\psi = \lambda\,\psi$$

 ${\ensuremath{\mathcal{D}}}$  is the Dirac operator in presence of gauge and/or spin connection

Define Chiral spinors

$$\psi_{\pm} = \mathcal{P}_{\pm}\psi$$
 ,  $\mathcal{P}_{\pm} = \left(\frac{1 \mp \gamma_{2n+1}}{2}\right)$ 

action of Dirac operator flips chirality

$$\not\!\!\!D \psi = \lambda \psi$$

 $\ensuremath{\mathcal{D}}$  is the Dirac operator in presence of gauge and/or spin connection

Define Chiral spinors

$$\psi_{\pm} = \mathcal{P}_{\pm}\psi$$
 ,  $\mathcal{P}_{\pm} = \left(\frac{1 \mp \gamma_{2n+1}}{2}\right)$ 

action of Dirac operator flips chirality

#### the number of positive (negative) chirality zero mode $n_+$ ( $n_-$ ).

# Application of index theorem

#### Anomaly is (controlled) quantum violation of a classical symmetry

Massless Dirac fermion enjoys the following symmetry (Chiral symmetry)

$$\Psi(x) \longrightarrow \exp\left[\mathbf{i}\,\gamma_{2n+1}\,\theta\right]\Psi(x)$$

However, the path integral measure doesn't obey this symmetry. Non-invariance of the measure comes only from the zero mode of the Dirac operator and hence controlled by the index theorem.

# Application of index theorem

- Anomaly is (controlled) quantum violation of a classical symmetry
- Massless Dirac fermion enjoys the following symmetry (Chiral symmetry)

$$\Psi(x) \longrightarrow \exp\left[\mathbf{i}\,\gamma_{2n+1}\,\theta\right]\Psi(x)$$

However, the path integral measure doesn't obey this symmetry. Non-invariance of the measure comes only from the zero mode of the Dirac operator and hence controlled by the index theorem.

# Application of index theorem

- Anomaly is (controlled) quantum violation of a classical symmetry
- Massless Dirac fermion enjoys the following symmetry (Chiral symmetry)

$$\Psi(x) \longrightarrow \exp\left[\mathbf{i} \, \gamma_{2n+1} \, \theta\right] \Psi(x)$$

However, the path integral measure doesn't obey this symmetry. Non-invariance of the measure comes only from the zero mode of the Dirac operator and hence controlled by the index theorem.

#### A quantum mechanical system is defined a Hamiltonian

 $H|\Psi
angle=E|\Psi
angle$ 

 A Supersymmetric QM system is actually a pair\* of Quantum mechanical system.

$$|b\rangle$$
 ,  $|f\rangle$ 

It is defined by a super-charge

$$Q^2 = H$$
 ,  $Q|b\rangle = |f\rangle$  ,  $Q|f\rangle = |b\rangle$ 

$$W(\beta) = \operatorname{Tr}\left[(-1)^{\mathsf{F}} e^{-\beta H}\right]$$

A quantum mechanical system is defined a Hamiltonian

### Dirac index for manifold with boundary

# Atiyah-Patodi-Singer index theorem

The **boundary term** for the variation of the Dirac action is (roughly) of the form

$$\int_{\partial \mathcal{M}} \left[ \psi_+ \cdot \delta \psi_+ - \psi_- \cdot \delta \psi_- \right]$$

One can impose (local) boundary condition

$$\psi_{\pm}\Big|_{\partial\mathcal{M}} = \pm\psi_{\pm}\Big|_{\partial\mathcal{M}}$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

Not good for index problem.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

Not good for index problem.

 Any local boundary doesn't preserve chiral current and hence not good for index problem

 APS invented a non-local boundary condition to define the index problem

However, this boundary condition can be thought of as a euclidean continuation of Feynman iε (scattering) boundary condition.

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

# Is there a path-integral derivation of APS index theorem ?

How to put field space boundary condition in path integral formalism?

### Revisiting the basics

Let's start from the basic defn of Witten index

$$W(\beta) = \operatorname{Tr}\left[(-1)^{\mathrm{F}} e^{-\beta H}
ight]$$

For compact manifold (with/without boundary), the spectrum is discrete. One can use supersymmetry to prove W(β) gets contribution only from zero energy states and hence

$$W(\beta) = W(0) = W(\infty)$$

Index of an operator is defined as

$$\mathcal{I} \equiv W(\infty)$$

### Revisiting the basics

ight]$$

For compact manifold (with/without boundary), the spectrum is discrete. One can use supersymmetry to prove W(β) gets contribution only from zero energy states and hence

$$W(\beta) = W(0) = W(\infty)$$

Index of an operator is defined as

$$\mathcal{I} \equiv W(\infty)$$

- introduces continuum of scattering states
- The states of the compact manifold is simply the bound states of the non-compact manifold
- The definition of the Witten index has to be appropriately modified. One needs to use the concept of Gelfand triplet.
- Supersymmetric cancellation of states doesn't hold scattering states; Witten index depends on β.

**Assumption:** we *assume* that the continuum is separated from zero

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

$$\widehat{W}(\beta) = \mathrm{Tr}_{\scriptscriptstyle bound} \left[ (-1)^{\mathrm{F}} e^{-\beta H} \right] + \mathrm{Tr}_{\scriptscriptstyle scattering} \left[ (-1)^{\mathrm{F}} e^{-\beta H} \right]$$

Since we assumed that the scattering state is separated from zero,

$$\widehat{W}(\infty) = \lim_{eta 
ightarrow \infty} \mathrm{Tr}_{_{bound}} \left[ (-1)^{\mathrm{F}} e^{-eta H} 
ight]$$

So this gives the index of compact manifold. However it is more difficult to compute. So rewrite the above equation as

$$egin{aligned} \widehat{\mathcal{W}}(\infty) &=& \widehat{\mathcal{W}}(0) + \left[\widehat{\mathcal{W}}(\infty) - \widehat{\mathcal{W}}(0)
ight] \ &\simeq& \mathrm{AS} - rac{1}{2}\eta \end{aligned}$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

### Computing $\eta$ invariant

We start from our guess

$$egin{array}{rcl} \eta(eta) &:= & 2(\widehat{W}(eta) - \widehat{W}(\infty)) \ &= & 2\sum_{\lambda} \int dk \left[ 
ho_+^{\lambda}(k) - 
ho_-^{\lambda}(k) 
ight] e^{-eta E(k)} \end{array}$$

Now the difference of density of state is related to deference of phase shift

$$\rho_+^{\lambda}(k) - \rho_-^{\lambda}(k) = \frac{1}{\pi} \frac{d}{dk} \left[ \delta_+^{\lambda}(k) - \delta_-^{\lambda}(k) \right] \,.$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

 $\delta^{\lambda}_{\pm}(k)$  are the phase shifts.

Let the asymptotic form of the scattering wave functions is

$$\psi_{\pm}^{\lambda k}(u) \sim c_{\pm}^{\lambda} \left[ e^{\mathbf{i}ku} + e^{\mathbf{i}\delta_{\pm}^{\lambda}(k) - \mathbf{i}ku} \right]$$

where  $\delta_{\pm}^{\lambda}(k)$  are the phase shifts.

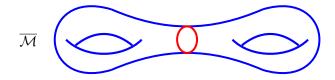

Now one can use supersymmetry to determine the difference of phase shift just from the asymptotic data

$$2\delta^{\lambda}_{+}(k) - 2\delta^{\lambda}_{-}(k) = -\mathbf{i} \ln \left( rac{\mathbf{i}k + \lambda}{\mathbf{i}k - \lambda} 
ight) + \pi$$

So the final result is

$$\sum_{\lambda} \operatorname{sgn}(\lambda) \operatorname{Erfc}\left(|\lambda| \sqrt{\frac{\beta}{2}}\right)$$

#### Double it to get a compact manifold without boundary

### Part II: Mock modular form

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

### Modular form

Modular group  $SL(2,\mathbb{Z})$ :

$$au \longrightarrow rac{a au + b}{c au + d} \qquad , \qquad ad - bc = 1 \qquad a, b, c, d \in \mathbb{Z}$$

Modular form  $f(\tau)$ :

• Holomoprhic on the upper half plane  ${
m Im} au>0$ 

Obeys the following relation

$$f\left(\frac{a\tau+b}{c\tau+d}\right) = (c\tau+d)^k f(\tau)$$

・ロト・西ト・山田・山田・山口・

### Modular form

Modular group  $SL(2,\mathbb{Z})$ :

$$au \longrightarrow rac{a au + b}{c au + d} \qquad , \qquad ext{ad} - bc = 1 \qquad ext{a}, b, c, d \in \mathbb{Z}$$

Modular form  $f(\tau)$ :

▶ Holomoprhic on the upper half plane Imτ > 0
 ▶ Obeys the following relation

$$f\left(\frac{a\tau+b}{c\tau+d}\right) = (c\tau+d)^k f(\tau)$$

h is called mock-modular form

The elliptic genus of a compact (without boundary) CFT can be written as a sum of Dirac indices.

The elliptic genus of a non-compact CFT is (mixed-)mock modular.

Dirac indices of non-compact manifold is regular dependent

Only these pieces are there for compact manifold without boundary; they are  $\beta$  ( $\bar{\tau}$ ) independent

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Sensitive only to the boundary

# Don't know in general !

# However, we observe some connections in case of cigar !

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQの

Cigar is a two dimensional non-compact manifold. The metric is given by

$$ds^2 = k \left( d\rho^2 + \tanh^2 \rho \, d\psi^2 \right)$$

 $\psi$  is a periodic direction with period  $2\pi.$  The Dirac operator near the boundary takes the form

$$\begin{split} \mathbf{i} \mathbf{D} &= \gamma^{r} (\mathbf{i} \partial_{r} - w \, \mathcal{K}_{r}) + \gamma^{\theta} (\mathbf{i} \partial_{\theta} - w \, \mathcal{K}_{\theta}) \\ &= i \gamma^{r} \bigg[ \partial_{r} - \frac{1}{\tanh r} \begin{pmatrix} -1 & 0 \\ 0 & 1 \end{pmatrix} (\mathbf{i} \partial_{\theta} - w \, k \tanh^{2} r) \bigg] \end{split}$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ ○○○

Lots of work on Cigar Elliptic genus by Various people Ashok, Doroud, Troost; Murthy,...

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

We computed from supersymmetric sigma model.

The EG of Cigar SCFT is a Mock Jacobi form of weight 1/2.

$$-i\frac{\vartheta_1(\tau,z)}{\eta^3(\tau)}\sum_{w}\sum_{n}\left[\frac{1}{2}\mathrm{sgn}\left(\frac{n}{k}-w\right)\mathrm{Erfc}\left(\sqrt{k\pi\tau_2}\left|w-\frac{n}{k}\right|\right)\right.\\\left.-\mathrm{sgn}(n\mathrm{im}\ \tau)\Theta\left[w\left(\frac{n}{k}-w\right)\right]\right]q^{-(n-wk)^2/4k}q^{(n+wk)^2/4k}y^{J_L}$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

#### Observations

In the  $au_2 
ightarrow \infty$  limit we obtain

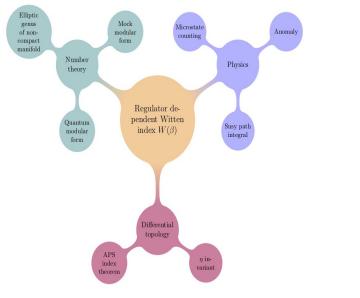

$$\widehat{\chi}(\tau, \overline{\tau}|z) = 0$$

In the  $\tau_2 \rightarrow 0$  limit we obtain

$$-i\frac{\theta_1(\tau_1,z)}{\eta(\tau_1)^3}\sum_{w,n}\left[\left(-\mathrm{sgn}(n)+\frac{1}{2}\mathrm{sgn}\left(\frac{n}{k}-w\right)\right]e^{2\pi i\tau_1nw}y^{\frac{n+wk}{k}}\right]$$

But we know the AS piece vanishes in 2 dimensions One can consider the radial limit  $(\tau_2 \rightarrow 0^+)$  of the non-holomophic part to obtain (vector-valued) 'quantum modular forms' (in this case the weight is 1/2)

# Summary

1. To Extend the proof APS index theorem using scattering for a more general type of manifolds

2. Is it possible to make the connection non-compact elliptic genus and APS index precise

3. Given a Dirac operator on a manifold with boundary, we know how to compute and boundary operator and it's eta invariant. Similarly, given a non-compact CFT, is it possible to write down systematic steps to compute the shadow?
